ALUMINUM ELECTROLYTIC CAPACITORS

1.Scope

This specification covers"KRM series" miniature single-ended aluminium electrolytic capacitors.

2. Operating Temperature Range

Operating temperature range is the range of ambient temperature at which the capacitor can be operated continuously at rated voltage.

3.Characteristics

Unless otherwise specified, the standard range of atmospheric conditions for making measurements and tests are as follows.

Ambient temperature : 15 to 35° C

Air pressure: 86kpa to 106kpa

If there may be doubt on the results, measurements shall be made within the following limits.

Ambient temperature : 20±2°C

Air pressure: 86kpa to 106kpa

4.Frequency Coefficient for Ripple Current

Rated voltage (V)	Frequency (Hz) Capacitance(µF)	50 · 60	120	1K	10K	100K
	CAP≤10	0.80	1.00	1.30	1.65	1.70
6 2 100	10 <cap≤100< td=""><td>0.80</td><td>1.00</td><td>1.23</td><td>1.48</td><td>1.53</td></cap≤100<>	0.80	1.00	1.23	1.48	1.53
6.3-100	100 <cap≤1000< td=""><td>0.80</td><td>1.00</td><td>1.16</td><td>1.35</td><td>1.38</td></cap≤1000<>	0.80	1.00	1.16	1.35	1.38
	1000 <cap< td=""><td>0.80</td><td>1.00</td><td>1.11</td><td>1.25</td><td>1.28</td></cap<>	0.80	1.00	1.11	1.25	1.28
160 to 500	0.47 to 330	0.80	1.00	1.30	1.40	1.60

5.Coefficient of Temperature for Ripple Current

Temperature (°C) Rated voltage (V)	70 or less	85	105
6.3 to 100	2.00	1.70	1.00
160 to 500	1.80	1.40	1.00

NOTE: Temperature coefficient is not used in life formula but for reference.

6.Max. Impedance Ratio

	Rated	voltage(V)	6.3	10	16	25-100	160-250	350-500

11.Mechanical Characteristics:

NO.	ITEM	TEST METHOD	SPECIFICATION
NO. 11.1	Lead strength	TEST METHOD (A)Tensile strength: Wire lead terminal: $\overline{d(mm)} \le 0.5$ $0.5 < d \le 0.8$ $0.8 < d \le 1.25$ $\overline{bad(kg)}$ 0.5 1.0 2.0 The capacitor shall withstand the constant tensile force specified between the body and each lead for 10seconds without damage either mechanical or electrical. (B) Bending strength: Wire lead terminal: $\overline{d(mm)} \le 0.5$ $0.5 < d \le 0.8$ $0.8 < d \le 1.25$ $\overline{bad(kg)}$ 0.5 $0.5 < d \le 0.8$ $0.8 < d \le 1.25$ $\overline{bad(kg)}$ 0.5 $0.5 < d \le 0.8$ $0.8 < d \le 1.25$ $\overline{bad(kg)}$ 0.5 $0.5 < d \le 0.8$ $0.8 < d \le 1.25$ $\overline{bad(kg)}$ 0.5 $0.5 < 1.0$ $0.5 < 1.0$ With the capacitor in a vertical position apply the load specified axially to each lead. The capacitor shall be rotated slowly from the vertical to the horizontal position, back to the vertical position. The 90° in the opposite direction and back the original position. Performance of capacitor shall not have change and leads shall be undamaged.	SPECIFICATION When the capacitance is measured, there shall be no intermittent contacts, or open-or short-circuiting. There shall be no such mechanical damage as terminal damage etc.
		change and leads shall be undamaged.	

ALUMINUM ELECTROLYTIC CAPACITORS

NO.	ITEM	TEST METHOD	SPECIFICATION
11.2	Vibration resistance	The frequency of the vibration shall vary uniformly within the range 10 to 55 Hz with the amplitude of 0.75mm, completing the cycle in the internal of one minute. The capacitor shall be securely mounted by its leads with hold the body of capacitor. The capacitor shall be vibrated in three mutually perpendicular directions for a period of 2 hours in each direction.	Capacitance: no unsteady. Appearance: no abnormal. Capacitance change: within±5% of initial measured value.
11.3	Solder -ability	The leads are dipped in the solder bath of Sn at $245^{\circ}C\pm 5^{\circ}C$ for 2 ± 0.5 seconds. The dipping depth should be set at $1.5\sim 2.0$ mm.	The solder alloy shall cover the 95% or more of dipped lead's area.

12. Reliability:

NO.	ITEM	TEST METHOD	SPECIFICATION
12.1	Soldering heat resistance	The leads immerse in the solder bath of Sn at 260°C±5°C for 10±1seconds until a distance of 1.5~2.0mm from the case.	No visible damage or leakage of electrolyte. Capacitance change: Within±5% of the initial measured value Tanδ: Less than specified value. Leakage current: Less than specified value
12.2	Moisture Resistance	Subject the capacitor to 40°C±2°C and 90% to 95% relative humidity for 504 hours.	Capacitance change: Within \pm 20% of the initial measured value Tan δ : Less than 1.2 specified value. Leakage current: Less than specified value

ALUMINUM ELECTROLYTIC CAPACITORS

NO.	ITEM	TEST METHOD	SPECIFICATION
12.3	Load life	After 2000 hours continuous application of DC rated working voltage and rated ripple current at 105°C±2°C, Measurements shall be performed after 16 hours exposed at room temperature.	Capacitance change: within±20% of the initial specified value.
12.4	Shelf life	After storage for 1000 hours at 105°C±2°Cwithout voltage application, at operating temperature which the capacitor can be operated continuously at rated voltage 30 min, Measurements shall be performed after exposed for 16 hrs after application of Testing.	Dissipation factor: Less than 200% of the initial specified value. Leakage current: Within initial specified value.
12.5	Storage at low temperature	The capacitor shall be stored at temperature of -40°C±3°C for 16 hours, during which time be subjected to standard atmospheric conditions for 16 hours or more. After which measurements shall be made.	Capacitance change: Within ±10% of the initial value. Tanδ:less than specified value Leakage current: Less than specified value. Appearance :no Abnormal.
12.6	Pressure relief	DC test: Send the following electricity while applying the inverse voltage. Where case size D≤22.4mm:1 A d.c.max D > 22.4mm:10 A d.c.max Note: 1.This requirement applies to capacitors with a diameter of 6 mm or more. 2. When the pressure relief device does not open even 30 minutes after commencement of test, the test may be ended.	DC test circuit S DC test circuit S Cx Cx Cx Cx Cx Cx Cx Cx Cx Cx

ALUMINUM ELECTROLYTIC CAPACITORS

Cautions for Using Aluminum Electrolytic Capacitors

- 1. When reverse voltage is applied on DC aluminum electrolytic capacitor ,the circuit will be short out and the capacitor will be damaged due to abnormal current flows through the capacitor. Please use non- polar types of capacitors when the positive voltage is applied on the cathode terminal.
- 2. When capacitor is used at higher voltage than the rated voltage, leakage current increased, characteristics drastically deteriorated and damaged in a short period may occur as a result. Please take extra caution that the peak voltage should not exceed the rated voltage.
- 3. Sudden charge and discharge

When aluminum electrolytic capacitors for general purpose-use are employed in rapid charge and discharge application, its life expectancy may be shortened resulted from capacitance decrease, heat rise, etc.

4. Storage of the capacitor

①We recommend the following conditions for storage:

Ambient temperature: 5~35℃, Ambient humidity: <75%RH;

- a) Storage life: ≤ 12 months;
- b) If storage life >12 months, the products need to be charged again before using;
- c) If Storage time >three years, the products need to be discarded;
- d) Expiry Date: calculating from the date marked on the sleeve;
- e) Please keep capacitors in the original package;
- f) Avoid storing the capacitors under such circumstances:
- % With water and oil or damp & dewing location.
- % With gas and oil.
- % With toxic gases such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine, bromine and methane.
- % With direct sunlight, Ozone, ultraviolet rays or radiation.

5. If excessive ripple current is applied on the capacitor, excessive heat will be generated inside, the capacitance will be reduced and capacitor's life shall be shortened. Rated voltage has been marked on the capacitor; therefore, the peak value of the ripple voltage should be less than the rated voltage.

6. Ambient temperature

Life of aluminum electrolytic capacitor is affected by the ambient temperature. It is generally known that the life doubles for each 10° C decrease in temperature.

7. Tensile strength of lead wire

When a strong force is applied to the lead wires or terminals, stress is put on the internal connections, which may result in short circuit, open circuit or increased leakage current. So it is not advisable to bend or handle a capacitor after it has been soldered to the PC board.

8. Heat resistance at the soldering process

During soldering process, secondary shrinkage or sleeve crack may occur when soldering temperature is too high or soldering time is too long.

9. Hole pitch and position of PC board

When designing a PC board, its hole pitch should be designed to coincide with the lead pitch (lead spacing) of the capacitor specified in the catalog or specifications. When a capacitor is forcibly inserted into an unmatched hole pitch, a force will put on the leads and which could result in a short circuit or increased leakage current.

10. Cleaning after soldering

Koshin

① The aluminum electrolyte capacitors should be fee halogenated solvents during board cleaning after soldering. Use solvent proof capacitors when halogenated solvents are used.

② After cleaned with the solvent which should proof the quality of capacitors, the capacitors should not be kept in solvent environments of non-ventilated places. Let the capacitors after cleaning dry with hot blast fully above 10mins and the temperature of hot blast should not be over than specified upper limit of capacitors.

11. Adhesives, fixative and coating materials(coating agent)

Do not use halogenated adhesives and coating materials to fix aluminum electrolytic capacitors.
 Do not cover up all the sealing area of capacitors with adhesives
 fixative or coating materials(coating agent),
 make coverage only partial

12. Certificates

① ISO 9001:2008 Certificate

2 ISO 14001:2004 Certificate

③ISO/TS 16949:2009 Certificate

④OHSAS 18001:2007 Certificate

% RoHS2.0 compliance

Accord with the latest standard of RoHS2.0, if customers have any special requirments, according to the relevant agreements which signed by both parts.
