

# OPAx373, OPAx374 6.5-MHz, 585- $\mu$ A, Rail-to-Rail I/O CMOS Operational Amplifier

## 1 Features

- Low Offset: 5 mV (Maximum)
- Low  $I_B$ : 10 pA (Maximum)
- High Bandwidth: 6.5 MHz
- Rail-to-Rail Input and Output
- Single Supply: 2.3 V to 5.5 V
- Shutdown: OPAx373
- Specified up to 125°C
- *Microsize Packages*: 5-Pin SOT-23, 6-Pin SOT-23, 8-Pin SOT-23, and 10-Pin VSON

## 2 Applications

- Portable Equipment
- Battery-Powered Devices
- Active Filters
- Driving A/D Converters

## 3 Description

The OPA373 and OPA374 families of operational amplifiers are low power and low cost with excellent bandwidth (6.5 MHz) and slew rate (5 V/ $\mu$ s). The input range extends 200 mV beyond the rails and the output range is within 25 mV of the rails. The speed-power ratio and small size make them ideal for portable and battery-powered applications.

The OPA373 family includes a shutdown mode. Under logic control, the amplifiers can be switched from normal operation to a standby current that is less than 1  $\mu$ A.

The OPA373 and OPA374 families of operational amplifiers are specified for single or dual power supplies of 2.7 V to 5.5 V, with operation from 2.3 V to 5.5 V. All models are specified for  $-40^\circ\text{C}$  to 125°C.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
OPA373	SOIC (8)	4.90 mm x 3.91 mm
	SOT-23 (6)	2.90 mm x 1.60 mm
OPA374	SOIC (8)	4.90 mm x 3.91 mm
	SOT-23 (5)	2.90 mm x 1.60 mm
OPA2373	VSON (10)	3.00 mm x 3.00 mm
	VSSOP (10)	3.00 mm x 3.00 mm
OPA2374	SOIC (8)	4.90 mm x 3.91 mm
	SOT-23 (8)	2.90 mm x 1.63 mm
OPA4374	SOIC (14)	8.65 mm x 3.91 mm
	TSSOP (14)	5.00 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

Changes from Revision E (May 2008) to Revision F	Page
• Added <i>ESD Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	<b>1</b>
• Deleted <i>Package/Ordering Information</i> table; refer to <i>Package Option Addendum</i> at the end of this data sheet .....	<b>4</b>
• Deleted <i>lead temperature</i> specification from Absolute Maximum Ratings .....	<b>7</b>
• Changed values in the <i>Thermal Information</i> tables to align with JEDEC standards.....	<b>7</b>

## 5 Device Comparison Table

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	Supply		7	V
	Signal input pin <sup>(2)</sup>	-0.5	(V+) + 0.5	
Current	Signal input pin <sup>(2)</sup>	-10	10	mA
	Output short-circuit <sup>(3)</sup>	Continuous		
Temperature	Operating, T <sub>A</sub>	-55	150	°C
	Junction, T <sub>J</sub>		150	
	Storage, T <sub>stg</sub>	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails must be current limited to 10 mA or less.
- (3) Short-circuit to ground, one amplifier per package.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±3000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
	Supply voltage	±1.35 (2.7)	±2.75 (5.5)	V
T <sub>A</sub>	Operating temperature	-40	125	°C

### 7.4 Thermal Information: OPA373

THERMAL METRIC <sup>(1)</sup>		OPA373		UNIT
		D (SOIC)	DBV (SOT-23)	
		8 PINS	6 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	128.4	184.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	76.7	146.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	68.8	36.4	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	27.9	33.6	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	68.3	35.9	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	—	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Thermal Information: OPA374

THERMAL METRIC <sup>(1)</sup>		OPA374		UNIT
		D (SOIC)	DBV (SOT-23)	
		8 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	125.1	220.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	71.7	129	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	65.5	46.4	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	26.2	21	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	65	45.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.6 Thermal Information: OPA2373

THERMAL METRIC <sup>(1)</sup>		OPA2373		UNIT
		DGS (VSON)	DRC (VSSOP)	
		10 PINS	10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	170.6	56.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	59.8	76.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	91	30.6	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	10.4	3.7	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	89.6	30.7	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	11.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.7 Thermal Information: OPA2374

THERMAL METRIC <sup>(1)</sup>		OPA2374		UNIT
		D (SOIC)	DCN (SOT-23)	
		8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	117.8	171.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	63.1	73.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	58.4	106.3	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	19.3	15.4	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	57.9	105.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.8 Thermal Information: OPA4374

THERMAL METRIC <sup>(1)</sup>		OPA4374		UNIT
		D (SOIC)	PW (TSSOP)	
		14 PINS	14 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	86.5	112.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	45	34.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	41.1	57.1	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	12.3	2.9	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	40.8	56.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.9 Electrical Characteristics: $V_S = 2.7\text{ V to }5.5\text{ V}$

At  $T_A = 25^\circ\text{C}$ ,  $R_L = 10\text{ k}\Omega$  connected to  $V_S/2$ , and  $V_{OUT} = V_S/2$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
<b>OFFSET VOLTAGE</b>							
$V_{OS}$	Input offset voltage	$V_S = 5\text{ V}$			1	5	mV
	Input offset voltage versus temperature	$T_A = -40^\circ\text{C to }125^\circ\text{C}$				6.5	mV
$dV_{OS}/dT$	Input offset voltage versus drift	$T_A = -40^\circ\text{C to }+125^\circ\text{C}$			3		$\mu\text{V}/^\circ\text{C}$
PSRR	Input offset voltage versus power supply	$V_S = 2.7\text{ V to }5.5\text{ V}$ , $V_{CM} < (V+) - 2\text{ V}$	$T_A = 25^\circ\text{C}$		25	100	$\mu\text{V}/\text{V}$
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$			150	
	Channel separation, DC				0.4		$\mu\text{V}/\text{V}$
		At $f = 1\text{ kHz}$			128		dB
<b>INPUT VOLTAGE</b>							
$V_{CM}$	Common-mode voltage range			$(V-) - 0.2$		$(V+) + 0.2$	V
CMRR	Common-mode rejection ratio	$(V-) - 0.2\text{ V} < V_{CM} < (V+) - 2\text{ V}$	$T_A = 25^\circ\text{C}$	80	90		dB
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$	70			
		$V_S = 5.5\text{ V}$ , $(V-) - 0.2\text{ V} < V_{CM} < (V+) + 0.2\text{ V}$	$T_A = 25^\circ\text{C}$	66			dB
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$	60			dB
<b>INPUT BIAS CURRENT</b>							
$I_B$	Input bias current				$\pm 0.5$	$\pm 10$	pA
$I_{OS}$	Input offset current				$\pm 0.5$	$\pm 10$	pA
<b>INPUT IMPEDANCE</b>							
	Differential				$10^{13} \parallel 3$		$\Omega \parallel \text{pF}$
	Common-mode				$10^{13} \parallel 6$		$\Omega \parallel \text{pF}$
<b>NOISE</b>							
	Input voltage noise	$V_{CM} < (V+) - 2\text{ V}$ , $f = 0.1\text{ Hz to }10\text{ Hz}$			10		$\mu\text{V}_{PP}$
$e_n$	Input voltage noise density	$V_{CM} < (V+) - 2\text{ V}$ , $f = 10\text{ kHz}$			15		$\text{nV}/\sqrt{\text{Hz}}$
$i_n$	Input current noise density	$V_{CM} < (V+) - 2\text{ V}$ , $f = 10\text{ kHz}$			4		$\text{fA}/\sqrt{\text{Hz}}$
<b>OPEN-LOOP GAIN</b>							
$A_{OL}$	Open-loop voltage gain	$V_S = 5\text{ V}$ , $R_L = 100\text{ k}\Omega$ , $0.025\text{ V} < V_O < 4.975\text{ V}$	$T_A = 25^\circ\text{C}$	94	110		dB
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$	80			
		$V_S = 5\text{ V}$ , $R_L = 5\text{ k}\Omega$ , $0.125\text{ V} < V_O < 4.875\text{ V}$	$T_A = 25^\circ\text{C}$	94	106		dB
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$	80			
<b>OUTPUT</b>							
	Voltage output swing from rail	$R_L = 100\text{ k}\Omega$	$T_A = 25^\circ\text{C}$		18	25	mV
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$			25	mV
		$R_L = 5\text{ k}\Omega$	$T_A = 25^\circ\text{C}$		100	125	mV
			$T_A = -40^\circ\text{C to }125^\circ\text{C}$			125	mV
$I_{SC}$	Short-circuit current			See <a href="#">Typical Characteristics</a>			
$C_{LOAD}$	Capacitive load drive			See <a href="#">Typical Characteristics</a>			
$R_O$	Open-loop output impedance	$f = 1\text{ MHz}$ , $I_O = 0\text{ mA}$			220		$\Omega$

## Electrical Characteristics: $V_S = 2.7\text{ V to }5.5\text{ V}$ (continued)

At  $T_A = 25^\circ\text{C}$ ,  $R_L = 10\text{ k}\Omega$  connected to  $V_S/2$ , and  $V_{OUT} = V_S/2$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>FREQUENCY RESPONSE</b>						
GBW	Gain-bandwidth product	$C_L = 100\text{ pF}$		6.5		MHz
SR	Slew rate	$C_L = 100\text{ pF}$ , $G = +1$		5		V/ $\mu\text{s}$

## 8 Detailed Description

### 8.1 Overview

The OPAx373 and OPAx374 operational amplifiers (op amps) are suitable for a broad range of general-purpose applications. As unity-gain stable devices and outstanding AC performance, these op amps are ideal for audio applications. The class AB output stage is capable of driving 100-k $\Omega$  loads connected to any point between V+ and ground. These devices are well-suited for nearly any single-supply application up to a supply voltage of 5.5 V because the input common-mode voltage range includes both rails. Rail-to-rail input and output swing significantly increases the overall device dynamic range, especially in low-supply applications.

### 8.3 Feature Description

#### 8.3.1 Operating Voltage

The OPA373 and OPA374 op amps are specified and tested over a power-supply range of 2.7 V to 5.5 V ( $\pm 1.35$  V to  $\pm 2.75$  V). However, the supply voltage may range from 2.3 V to 5.5 V ( $\pm 1.15$  V to  $\pm 2.75$  V). Supply voltages higher than 7 V (absolute maximum) can permanently damage the amplifier. Parameters that vary over supply voltage or temperature are shown in the [Typical Characteristics](#).

## Feature Description (continued)

### 8.3.2 Common-Mode Voltage Range

The input common-mode voltage range of the OPA373 and OPA374 series extends 200 mV beyond the supply rails. This extended range is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair. The N-channel pair is active for input voltages close to the positive rail, typically  $(V+) - 1.65\text{ V}$  to 200 mV above the positive supply, while the P-channel pair is on for inputs from 200 mV below the negative supply to approximately  $(V+) - 1.65\text{ V}$ . There is a 500-mV transition region, typically  $(V+) - 1.9\text{ V}$  to  $(V+) - 1.4\text{ V}$ , in which both pairs are on. This 500-mV transition region, shown in [Figure 21](#), can vary  $\pm 300\text{ mV}$  with process variation. Thus, the transition region (that is, both stages on) can range from  $(V+) - 2.2\text{ V}$  to  $(V+) - 1.7\text{ V}$  on the low end, up to  $(V+) - 1.6\text{ V}$  to  $(V+) - 1.1\text{ V}$  on the high end. Within the 500-mV transition region, PSRR, CMRR, offset voltage, offset drift, and THD may be degraded, compared to device operation outside this region.

**Figure 21. Behavior of Typical Transition Region at Room Temperature**

### 8.3.3 Rail-to-Rail Input

The input common-mode range extends from  $(V-) - 0.2\text{ V}$  to  $(V+) + 0.2\text{ V}$ . For normal operation, inputs must be limited to this range. The absolute maximum input voltage is 500 mV beyond the supplies. Inputs greater than the input common-mode range but less than the maximum input voltage, while not valid, do not cause any damage to the op amp. Unlike some other op amps, if input current is limited, the inputs may go beyond the supplies without phase inversion, as shown in [Figure 22](#).

**Figure 22. OPA373: No Phase Inversion With Inputs Greater Than the Power-Supply Voltage**

Normally, input bias current is approximately 500 fA; however, input voltages exceeding the power supplies by more than 500 mV can cause excessive current to flow in or out of the input pins. Momentary voltages greater than 500 mV beyond the power supply can be tolerated if the current on the input pins is limited to 10 mA. This limiting is easily accomplished with an input resistor; see [Figure 23](#). Many input signals are inherently current-limited to less than 10 mA, therefore, a limiting resistor is not required.

## Feature Description (continued)

**Figure 23. Input Current Protection for Voltages Exceeding the Supply Voltage**

### 8.3.4 Rail-to-Rail Output

A class AB output stage with common-source transistors is used to achieve rail-to-rail output. For light resistive loads ( $> 100\text{ k}\Omega$ ), the output voltage can typically swing to within 18 mV from the supply rails. With moderate resistive loads (5 k $\Omega$  to 50 k $\Omega$ ), the output can typically swing to within 100 mV from the supply rails and maintain high open-loop gain. See [Figure 12](#) for more information.

### 8.3.5 Capacitive Load and Stability

The OPA373 series op amps can drive a wide range of capacitive loads. However, under certain conditions, all op amps may become unstable. Op amp configuration, gain, and load value are some of the factors to consider when determining stability. An op amp in unity-gain configuration is the most susceptible to the effects of capacitive load. The capacitive load reacts with the op amp output resistance, along with any additional load resistance, to create a pole in the small-signal response that degrades the phase margin. The OPA373 series op amps perform well in unity-gain configuration, with a pure capacitive load up to approximately 250 pF. Increased gains allow the amplifier to drive more capacitance. See [Figure 17](#) for further details.

One method of improving capacitive load drive in the unity-gain configuration is to insert a small (10- $\Omega$  to 20- $\Omega$ ) resistor,  $R_S$ , in series with the output, as shown in [Figure 24](#). This configuration significantly reduces ringing while maintaining DC performance for purely capacitive loads. When there is a resistive load in parallel with the capacitive load,  $R_S$  must be placed within the feedback loop as shown to allow the feedback loop to compensate for the voltage divider created by  $R_S$  and  $R_L$ .

Copyright © 2016, Texas Instruments Incorporated

**Figure 24. Series Resistor in Unity-Gain Configuration Improves Capacitive Load Drive**

## Feature Description (continued)

In unity-gain inverter configuration, phase margin can be reduced by the reaction between the capacitance at the op amp input and the gain setting resistors, thus degrading capacitive load drive. Best performance is achieved by using small-valued resistors. However, when large-valued resistors cannot be avoided, a small (4-pF to 6-pF) capacitor,  $C_{FB}$ , can be inserted in the feedback, as shown in Figure 25. This technique significantly reduces overshoot by compensating the effect of capacitance,  $C_{IN}$ , which includes the amplifier input capacitance and printed-circuit board (PCB) parasitic capacitance.

Figure 25. Improving Capacitive Load Drive

For example, when driving a 100-pF load in unity-gain inverter configuration, adding a 6-pF capacitor in parallel with the 10-k $\Omega$  feedback resistor decreases overshoot from 57% to 12%, as shown in Figure 26.

Figure 26. Improving Capacitive Load Drive

### 8.3.6 Enable or Shutdown

The OPA373 and OPA374 series op amps typically require 585- $\mu$ A quiescent current. The enable or shutdown feature of the OPA373 allows the op amp to be shut off to reduce this current to less than 1  $\mu$ A.

## 8.4 Device Functional Modes

The OPAx374 has a single functional mode and is operational when the power-supply voltage is greater than 2.7 V ( $\pm$ 1.35 V). The maximum power supply voltage for the OPAx374 is 5.5 V ( $\pm$ 2.75 V).

The OPAx373 has two functional modes: active and shutdown. When the voltage at the Enable pin is from  $V-$  to  $(V-) + 0.8$  V, the device is in shutdown and consumes less than 0.5  $\mu$ A of quiescent current (typical). To activate, or enable, the device, the voltage at the Enable pin must be from  $(V-) + 2$  V to  $V+$ . When active, the power-supply requirements are the same as the OPAx374.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The OPA373 and OPA374 series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. Rail-to-rail input and output make them ideal for driving sampling analog-to-digital converters (ADCs). Excellent AC performance makes them well-suited for audio applications. The class AB output stage is capable of driving 100-k $\Omega$  loads connected to any point between V+ and ground.

The input common-mode voltage range includes both rails, allowing the OPA373 and OPA374 series op amps to be used in virtually any single-supply application up to a supply voltage of 5.5 V. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications. Power-supply pins must be bypassed with 0.01- $\mu$ F ceramic capacitors.

### 9.2 Typical Application

This single-supply, low-side, bidirectional current-sensing solution detects load currents from  $-1$  A to  $1$  A. The single-ended output spans from 110 mV to 3.19 V. This design uses the OPA2374 because of its rail-to-rail input and output range and cost compared to performance. One of the amplifiers is configured as a difference amplifier, and the other amplifier provides the reference voltage.

Copyright © 2016, Texas Instruments Incorporated

Figure 27. Single-Supply, Low-Side, Bidirectional Current-Sensing Solution

#### 9.2.1 Design Requirements

This design has the following requirements:

- Supply voltage: 3.3 V
- Input:  $-1$  A to  $1$  A
- Output:  $1.65 \text{ V} \pm 1.54 \text{ V}$  (110 mV to 3.19 V)

## Typical Application (continued)

### 9.2.2 Detailed Design Procedure

The load current,  $I_{LOAD}$ , flows through the shunt resistor ( $R_{SHUNT}$ ) to develop the shunt voltage,  $V_{SHUNT}$ . The shunt voltage is then amplified by the difference amplifier, which consists of U1A and  $R_1$  through  $R_4$ . The gain of the difference amplifier is set by the ratio of  $R_4$  to  $R_3$ . To minimize errors, set  $R_2 = R_4$  and  $R_1 = R_3$ . The reference voltage,  $V_{REF}$ , is supplied by buffering a resistor divider using U1B. The transfer function is given by Equation 1.

$$V_{OUT} = V_{SHUNT} \times \text{Gain}_{\text{Diff\_Amp}} + V_{REF}$$

where

- $V_{SHUNT} = I_{LOAD} \times R_{SHUNT}$
- $\text{Gain}_{\text{Diff\_Amp}} = \frac{R_4}{R_3}$
- $V_{REF} = V_{CC} \times \left[ \frac{R_6}{R_5 + R_6} \right]$

(1)

There are two types of errors in this design: offset and gain. Gain errors are introduced by the tolerance of the shunt resistor and the ratios of  $R_4$  to  $R_3$  and, similarly,  $R_2$  to  $R_1$ . Offset errors are introduced by the voltage divider ( $R_5$  and  $R_6$ ) and how closely the ratio of  $R_4/R_3$  matches the ratio of  $R_2/R_1$ . The ratio of  $R_2/R_1$  impacts the CMRR of the difference amplifier, which ultimately translates to an offset error.

This is a low-side measurement. Therefore, the value of  $V_{SHUNT}$  is the ground potential for the system load. Thus, it is important to place a maximum value on  $V_{SHUNT}$ . In this design, the maximum value for  $V_{SHUNT}$  is set to 100 mV. Equation 2 calculates the maximum value of the shunt resistor given a maximum shunt voltage of 100 mV and maximum load current of 1 A.

$$R_{SHUNT\_Max} = \frac{|V_{SHUNT\_Max}|}{|I_{LOAD\_Max}|} = \frac{100 \text{ mV}}{1 \text{ A}} = 100 \text{ m}\Omega$$

(2)

The tolerance of  $R_{SHUNT}$  is directly proportional to cost. For this design, a shunt resistor with a tolerance of 0.5% was selected. If greater accuracy is required, select a 0.1% resistor or better.

Because the load current is bidirectional, the shunt voltage range is  $-100 \text{ mV}$  to  $100 \text{ mV}$ . This voltage is divided down by  $R_1$  and  $R_2$  before reaching the op amp, U1A. Take care to ensure that the voltage present at the noninverting node of U1A is within the common-mode range of the device.

It is therefore important to use an op amp, such as the OPA374, that has a common-mode range that extends below the negative supply voltage.

Given a symmetric load current of  $-1 \text{ A}$  to  $1 \text{ A}$ , the voltage divider resistors ( $R_5$  and  $R_6$ ) must be equal. To be consistent with the shunt resistor, a tolerance of 0.5% was selected. To minimize power consumption, 10-k $\Omega$  resistors were used.

To set the gain of the difference amplifier, the common-mode range and output swing of the OPA374 must be considered. Equation 3 and Equation 4 depict the typical common-mode range and output swing of the OPA374, given a 3.3-V supply.

$$-200 \text{ mV} < V_{CM} < 3.5 \text{ V}$$

(3)

$$100 \text{ mV} < V_{OUT} < 3.2 \text{ V}$$

(4)

The gain of the difference amplifier can now be calculated as shown in Equation 5.

$$\text{Gain}_{\text{Diff\_Amp}} = \frac{V_{OUT\_Max} - V_{OUT\_Min}}{R_{SHUNT} \times (I_{MAX} - I_{MIN})} = \frac{3.2 \text{ V} - 100 \text{ mV}}{100 \text{ m}\Omega \times [1 \text{ A} - (-1 \text{ A})]} = 15.5 \frac{\text{V}}{\text{V}}$$

(5)

The resistor value selected for  $R_1$  and  $R_3$  was 1 k $\Omega$ . 15.4 k $\Omega$  was selected for  $R_2$  and  $R_4$  because it is the nearest standard value. Therefore, the ideal gain of the difference amplifier is 15.4V/V.

Because the gain error of the circuit primarily depends on  $R_1$  through  $R_4$ , 0.1% resistors were selected. This value reduces the likelihood that the design requires a two-point calibration. A simple one-point calibration, if desired, removes the offset errors introduced by the 0.5% resistors.

## Typical Application (continued)

### 9.2.3 Application Curve

Figure 28. Output Voltage vs Input Current

## 9.3 System Examples

### 9.3.1 Driving ADCs

The OPA373 and OPA374 series op amps are optimized for driving medium-speed sampling ADCs. The OPA373 and OPA374 op amps buffer the ADC input capacitance and resulting charge injection, while providing signal gain.

The OPA373 is shown driving the ADS7816 in a basic noninverting configuration, as Figure 29 shows. The ADS7816 is a 12-bit, MicroPower sampling converter in the 8-pin VSSOP package. When used with the low-power, miniature packages of the OPA373, the combination is ideal for space-limited, low-power applications. In this configuration, an RC network at the ADC input can be used to provide anti-aliasing filtering.

## 10 Power Supply Recommendations

The OPAx373 and OPAx374 are specified for operation from 2.7 V to 5.5 V ( $\pm 1.35$  V to  $\pm 2.75$  V). Parameters that can exhibit significant variance with regard to operating voltage are presented in the [Typical Characteristics](#).

## 11 Layout

### 11.1 Layout Guidelines

The leadframe die pad must be soldered to a thermal pad on the PCB. A mechanical data sheet showing an example layout is attached at the end of this data sheet. Refinements to this layout may be required based on assembly process requirements.

Mechanical drawings located at the end of this data sheet list the physical dimensions for the package and pad. The five holes in the landing pattern are optional, and are intended for use with thermal vias that connect the leadframe die pad to the heat sink area on the PCB. Soldering the exposed pad significantly improves board-level reliability during temperature cycling, key push, package shear, and similar board-level tests.

Even with applications that have low-power dissipation, the exposed pad must be soldered to the PCB to provide structural integrity and long-term reliability.

#### 11.1.1 VSON Package

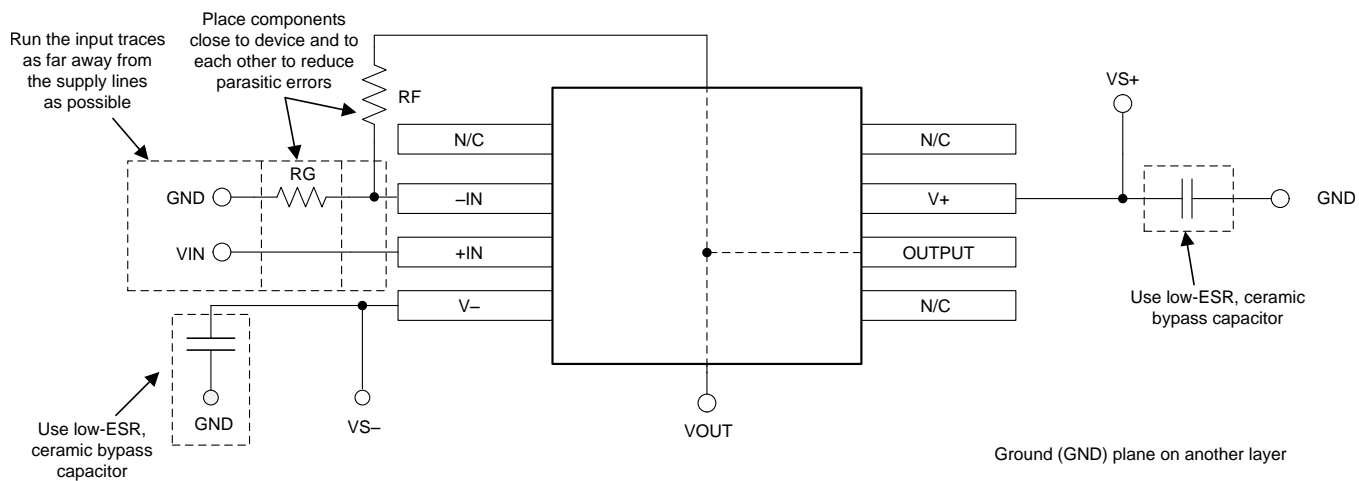

The OPA2373 is available in a 10-pin VSON package, which is a VQFN package with lead contacts on only two sides of the bottom of the package. This leadless, near-chip-scale package maximizes board space and enhances thermal and electrical characteristics through an exposed pad. VSON packages are physically small, have a smaller routing area, improved thermal performance, and improved electrical parasitics, with a pinout scheme that is consistent with other commonly-used packages, such as SOIC and VSSOP. Additionally, the absence of external leads eliminates bent-lead issues.

The VSON package can be easily mounted using standard PCP assembly techniques. See [QFN/SOP PCB Attachment](#) and [Quad Flatpack No-Lead Logic Packages](#), both available for download at [www.ti.com](http://www.ti.com).

#### NOTE

The exposed leadframe die pad on the bottom of the package must be connected to V-.

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 Development Support

##### 12.1.1.1 TINA-TI™ (Free Software Download)

TINA™ is a simple, powerful, and easy-to-use circuit simulation program based on a SPICE engine. TINA-TI™ is a free, fully-functional version of the TINA software, preloaded with a library of macro models in addition to a range of both passive and active models. TINA-TI provides all the conventional dc, transient, and frequency domain analysis of SPICE, as well as additional design capabilities.

Available as a [free download](#) from the Analog eLab Design Center, TINA-TI offers extensive post-processing capability that allows users to format results in a variety of ways. Virtual instruments offer the ability to select input waveforms and probe circuit nodes, voltages, and waveforms, creating a dynamic quick-start tool.

---

#### NOTE

These files require that either the TINA software (from DesignSoft™) or TINA-TI software be installed. Download the free TINA-TI software from the [TINA-TI folder](#).

---

##### 12.1.1.2 DIP Adapter EVM

The [DIP Adapter EVM](#) tool provides an easy, low-cost way to prototype small surface mount ICs. The evaluation tool these TI packages: D or U (8-pin SOIC), PW (8-pin TSSOP), DGK (8-pin MSOP), DBV (6-pin SOT-23, 5-pin SOT23, and 3-pin SOT-23), DCK (6-pin SC-70 and 5-pin SC-70), and DRL (6-pin SOT-563). The DIP Adapter EVM may also be used with terminal strips or may be wired directly to existing circuits.

##### 12.1.1.3 Universal Op Amp EVM

The [Universal Op Amp EVM](#) is a series of general-purpose, blank circuit boards that simplify prototyping circuits for a variety of IC package types. The evaluation module board design allows many different circuits to be constructed easily and quickly. Five models are offered, with each model intended for a specific package type. PDIP, SOIC, MSOP, TSSOP and SOT-23 packages are all supported.

---

#### NOTE

These boards are unpopulated, so users must provide their own ICs. TI recommends requesting several op amp device samples when ordering the Universal Op Amp EVM.

---

##### 12.1.1.4 TI Precision Designs

TI Precision Designs are analog solutions created by TI's precision analog applications experts and offer the theory of operation, component selection, simulation, complete PCB schematic and layout, bill of materials, and measured performance of many useful circuits. TI Precision Designs are available online at <http://www.ti.com/ww/en/analog/precision-designs/>.

##### 12.1.1.5 WEBENCH® Filter Designer

[WEBENCH® Filter Designer](#) is a simple, powerful, and easy-to-use active filter design program. The WEBENCH Filter Designer lets you create optimized filter designs using a selection of TI operational amplifiers and passive components from TI's vendor partners.

Available as a web-based tool from the WEBENCH® Design Center, [WEBENCH® Filter Designer](#) allows you to design, optimize, and simulate complete multistage active filter solutions within minutes.

## 12.2 Documentation Support

### 12.2.1 Related Documentation

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DBV (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
  - D. Falls within JEDEC MO-178 Variation AA.

DBV (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

PLASTIC SMALL OUTLINE NO-LEAD

4204102-3/L 09/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Small Outline No-Lead (SON) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance, if present.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions, if present

# THERMAL PAD MECHANICAL DATA

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
