Voltage Transducer DVM-UI series U_{PN} = 2000 ... 4000 V

Ref: DVM 2000-UI; DVM 4000-UI

For the electronic measurement of voltage: DC, AC (U_P ≥ 0 V), pulsed..., with galvanic separation between the primary and the secondary circuit.

Features

- Unipolar and insulated measurement from 0 to U_{PN}
- 4-20 mA instantaneous output
- Unipolar power supply
- Primary input and output connections with M5 studs.

Advantages

- Low consumption and low losses
- Compact design
- Very low sensitivity to common mode voltage variations
- Excellent accuracy (offset, sensitivity, linearity)
- Fast delay time
- Low temperature drift
- High immunity to external interferences.

Applications

- Substations
- Trackside.

Standards

- EN 50155: 2017
- EN 50121-3-2: 2016
- EN 50124-1: 2017
- IEC 62497-1: 2010
- IEC 61010-1: 2010
- IEC 62477-1: 2012
- UL 347 [1]: 2016

Application Domain

- Industrial and Railway (fixed installations and onboard).

Note: [1] When used with UL 347 Isolator N° 92.24.06.420.0.

2July2021/Version 2

Safety

Caution

If the device is used in a way that is not specified by the manufacturer, the protection provided by the device may be compromised.
Always inspect the electronics unit and connecting cable before using this product and do not use it if damaged.
Mounting assembly shall guarantee the maximum primary conductor temperature, fulfill clearance and creepage distance, minimize electric and magnetic coupling, and unless otherwise specified can be mounted in any orientation.

Caution, risk of electrical shock

This transducer must be used in limited-energy secondary circuits SELV according to IEC 61010-1, in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating specifications.

Use caution during installation and use of this product; certain parts of the module can carry hazardous voltages and high currents (e.g. power supply, primary conductor).
Ignoring this warning can lead to injury and or/or cause serious damage.
De-energize all circuits and hazardous live parts before installing the product.
All installations, maintenance, servicing operations and use must be carried out by trained and qualified personnel practicing applicable safety precautions.

This transducer is a build-in device, whose hazardous live parts must be inaccessible after installation.
This transducer must be mounted in a suitable end-enclosure.
Besides make sure to have a distance of minimum 30 mm between the primary terminals of the transducer and other neighboring components.

Main supply must be able to be disconnected.
Never connect or disconnect the external power supply while the primary circuit is connected to live parts.
Never connect the output to any equipment with a common mode voltage to earth greater than 30 V.

This transducer is a built-in device, not intended to be cleaned with any product. Nevertheless if the user must implement cleaning or washing process, validation of the cleaning program has to be done by himself.

ESD susceptibility
The product is susceptible to be damaged from an ESD event and the personnel should be grounded when handling it.

Do not dispose of this product as unsorted municipal waste. Contact a qualified recycler for disposal.

Underwriters Laboratory Inc. recognized component

UL 347: Ratings and assumptions of certification

File # E315896 Volume: 1 Section: 3

Standards

- CSA C22.2 No. 253 Medium-Voltage AC Contactors, Controllers, and Control Centers
- UL 347 Standards for Safety for Medium-Voltage AC Contactors, Controllers, and Control Centers.

Conditions of acceptability

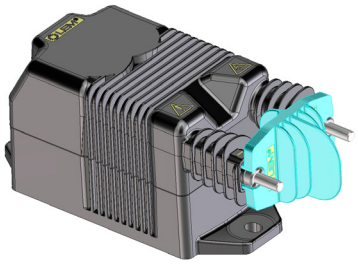

When installed in the end-use equipment, consideration shall be given to the following:

1 - These devices must be mounted in a suitable end-use enclosure.
2 - The terminals have not been evaluated for field wiring.
3 - The rated Basic Insulation Level (BIL) is 20 kV for this device, after performing Impulse Withstand Tests. Additional testing will be required if a higher BIL rating is desired.
4 - For products rated more than 2500 V, the specific kit model "UL 347 isolator" shall be mounted to the DVM.
5 - The products have been evaluated for a maximum surrounding air temperature of 85 °C..
6 - Low voltage circuits are intended to be powered by a circuit derived from an isolating source (such as a transformer, optical isolator, limiting impedance or electro-mechanical relay) and having no direct connection back to the primary circuit (other than through the grounding means).

Marking

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL's Follow-Up Service. Always look for the Mark on the product.

Assembly of UL 347 Isolator on primary studs.

UL 347 Isolator, reference number 92.24.06.420.0 provided.

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in “typical” graphs.
On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.
Unless otherwise stated (e.g. “100 % tested”), the LEM definition for such intervals designated with “min” and “max” is that the probability for values of samples to lie in this interval is 99.73 %.
For a normal (Gaussian) distribution, this corresponds to an interval between −3 sigma and +3 sigma. If “typical” values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between −sigma and +sigma for a normal distribution.
Typical, maximal and minimal values are determined during the initial characterization of the product.

LEM reserves the right to carry out modifications on its transducers,

Typical performance characteristics

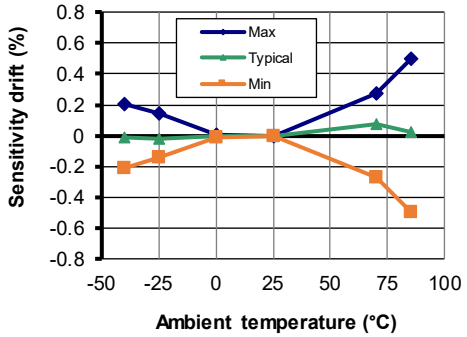

Figure 6: Sensitivity thermal drift

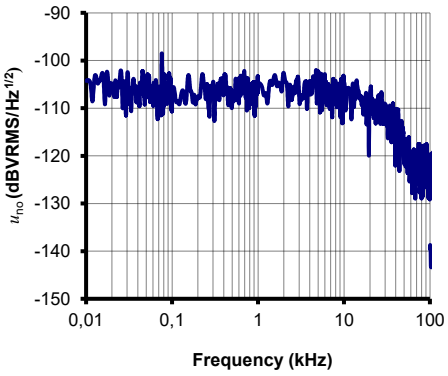

Figure 7: Typical output noise voltage spectral density u_{no} referred to secondary with R_M = 50 Ω

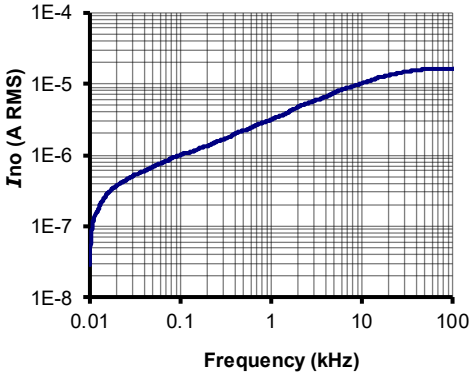

Figure 8: Typical total output RMS noise current I_{no} referred to secondary with R_M = 50 Ω

Figure 7 (output noise voltage spectral density) shows that there are no significant discrete frequencies in the output. Figure 8 confirms the absence of steps in the total output RMS noise current that would indicate discrete frequencies. To calculate the total output RMS noise in a frequency band $f1$ to $f2$, the formula is:
with I_{no}(f) read from figure 8 (typical, RMS value).

$$I_{no}(f_1 \text{ to } f_2) = \sqrt{I_{no}(f_2)^2 - I_{no}(f_1)^2}$$

Example:
What is the total output RMS noise from 100 to 1 kHz?
Figure 8 gives I_{no}(100 Hz) = 1.0 µA and I_{no}(1 kHz) = 3.13 µA.

$$\sqrt{(3.13 \times 10^{-6})^2 - (1.0 \times 10^{-6})^2} = 2.97 \text{ µA}$$

Therefore, the total output RMS noise current is 2.97 µA.

Terms and definitions

Simplified transducer model

The static model of the transducer with current output at temperature T_A is:

$$I_S = S \cdot U_P \cdot (1 + \varepsilon)$$

In which (referred to primary):

$$\varepsilon \cdot U_P = U_{OE} + U_{OT} + \varepsilon_S \cdot U_P + \varepsilon_{ST} \cdot U_P + \varepsilon_L(U_{P\,max}) \cdot U_{P\,max}$$

U_P	: primary voltage (V)
$U_{P\,max}$	: maximum primary voltage applied to the transducer (V)
I_S	: secondary current (A)
S	: sensitivity of the transducer
TCS	: temperature coefficient of S
T_A	: ambient operating temperature (°C)
U_{OE}	: electrical offset voltage (V)
U_{OT}	: temperature variation of U_{OE} (V)
ε_S	: sensitivity error at 25 °C
ε_{ST}	: thermal drift of S
$\varepsilon_L(U_{P\,max})$	: linearity error for $U_{P\,max}$

This model is valid for primary voltage U_P between $-U_P$ max and $+U_P$ max only.
This is the absolute maximum error. As all errors are independent, a more realistic way to calculate the error would be to use the following formula:

$$\varepsilon = \sqrt{\sum_{i=1}^{N} \varepsilon_i^2}$$

Total error referred to primary

The total error ε_{tot} is the error at $\pm U_{PN}$, relative to the rated value U_{PN}.
It includes all errors mentioned above

- the electrical offset U_{OE}
- the sensitivity error ε_S
- the linearity error ε_L (to U_{PN}).

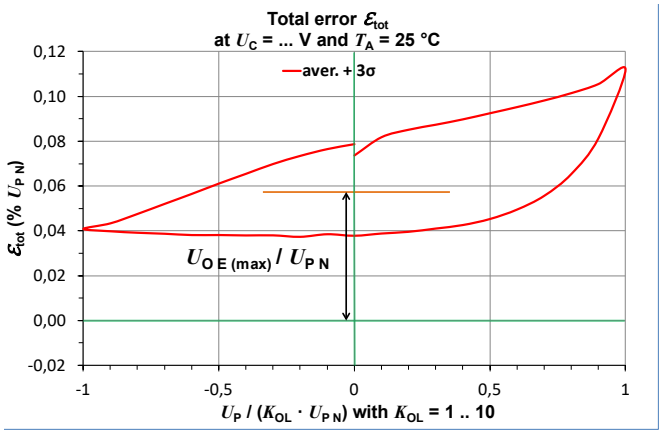

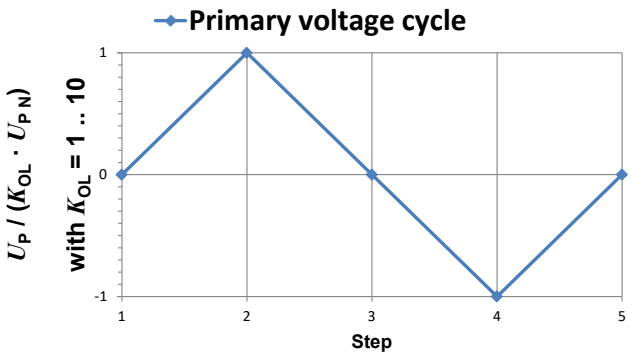

Figure 13: Total error ε_{tot}

Electrical offset referred to primary

K_{OL}: Overload factor
Figure 14: voltage cycle used to measure the electrical offset (transducer supplied)

Using the voltage cycle shown in previous figure, the electrical offset voltage U_{OE} is the residual output referred to primary when the input voltage is zero.
The temperature variation U_{OT} of the electrical offset voltage

$$U_{OE} = \frac{U_{P(3)} + U_{P(5)}}{2}$$

U_{OE} is the variation of the electrical offset from 25 °C to the considered temperature.

Sensitivity and linearity

$$U_{OT}(T) = U_{OE}(T) - U_{OE}(25°C)$$

To measure sensitivity and linearity, the primary voltage (DC) is cycled from 0 to U_P, then to $-U_P$ and back to 0 (equally spaced U_P/10 steps). The sensitivity S is defined as the slope of the linear regression line for a cycle between $\pm U_{PN}$.
The linearity error ε_L is the maximum positive or negative difference between the measured points and the linear regression line, expressed in % of U_{PN}.

Delay times

The delay time $t_{D\,10}$ @ 10 % and the delay time $t_{D\,90}$ @ 90 % with respect to the primary are shown in the next figure.
Both slightly depend on the primary current di/dt.
They are measured at nominal current.

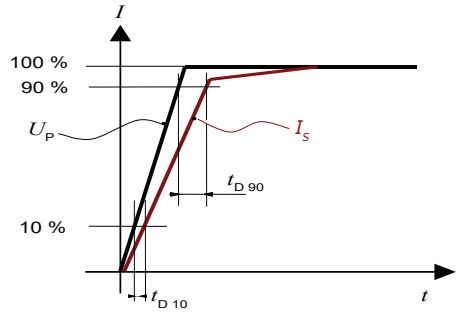

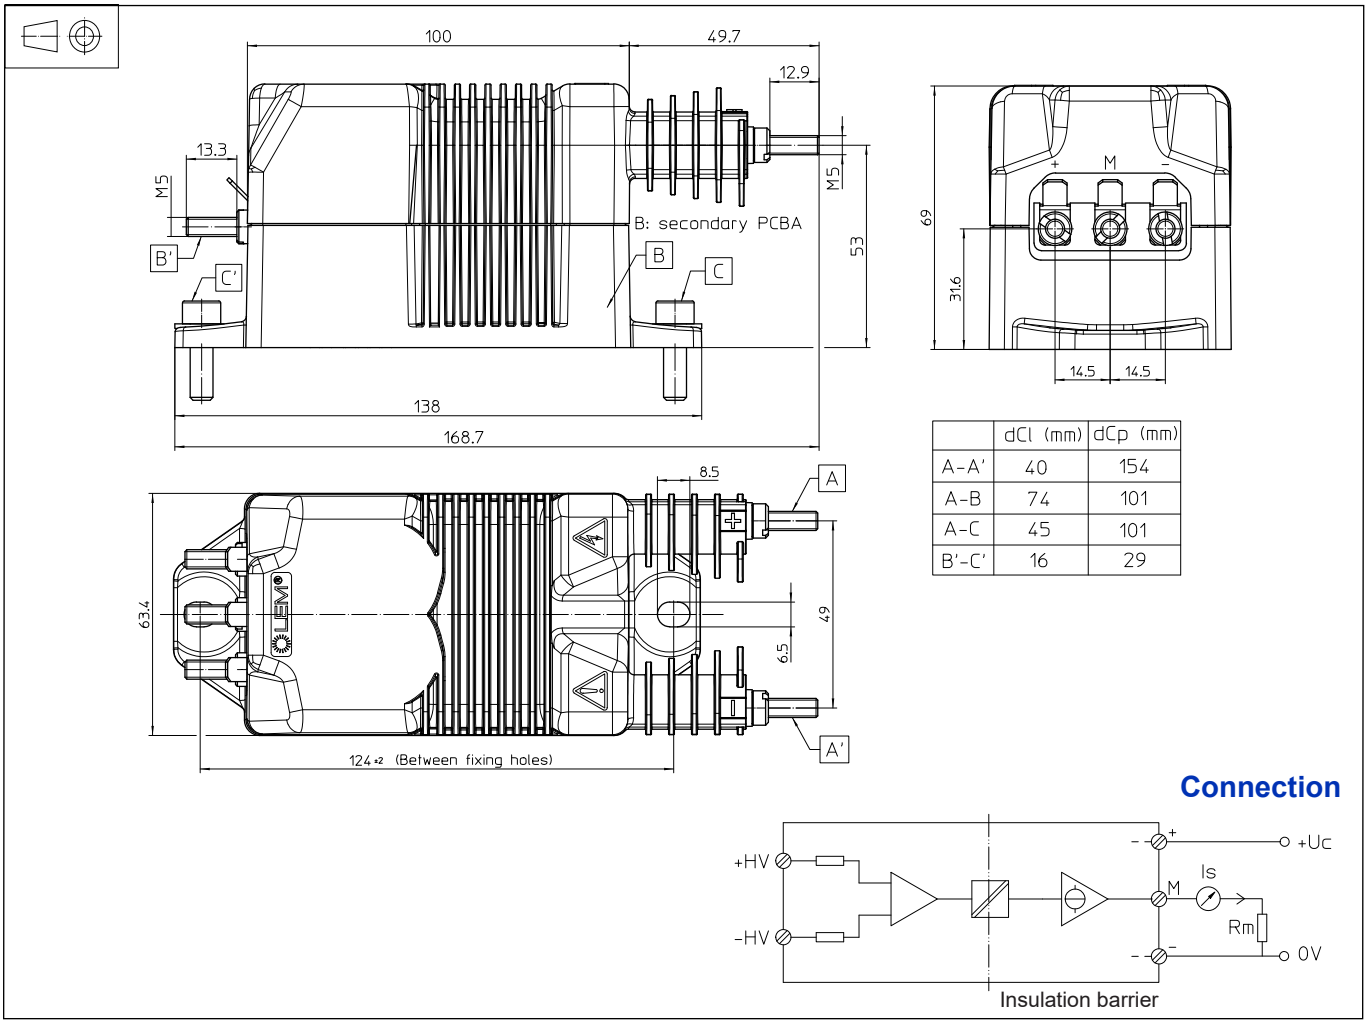

Figure 15: delay time $t_{D\,10}$ @ 10 % and delay time $t_{D\,90}$ @ 90 %.
